INSTRUCTION
HOW TO USE CREDIT TABLES

In general, the determination of the amount of credit that can be taken by college students is determined by: looking for a meeting point between the line drawn from the AB line (the line that shows the semester IP) and the AD line (which shows the cumulative IP).

Examples :

1) Person X (yellow line) Semester IP: 1.5 Cumulative : 2.2
   Then in the next semester, Person X can only take credits between 18-19 credits (obtained by drawing the meeting point line, tilted up).
2) Person X (black line) Semester IP: 2 Cumulative IP: 1.5
   Then in the next semester, Person X can only take credits between 17-18 credits (withdrawn from the meeting point, tilted down).
3) Person X (red line) Semester IP: 2.5 Cumulative GPA: 2.5
   Credits that can be taken in the following semester are only 22 credits (because the meeting point is exactly at number 22)
4) Person X (blue line) Semester IP: 2.7 Cumulative IP: 2.8
   Credits that can be taken in the following semester are only 23 credits (because the meeting point falls in the EMPTY box, then the credit is determined by looking at the number box above or to the right of the meeting point).

The Advisory Lecturer (DP) checks and certifies the completed semester study program. The amount of learning load is the responsibility of the DP in the range specified above.

TABLE OF MAXIMUM CREDIT
